
a
At a tight budget (10–17% of land) the trait target covers
10–12 more percentage points of functional space than the
species target; by 30% they converge.
Grey band: 95% of random selections.

Existing
reserves
GBF 30%
b
Complementarity beats richness ranking by ~9 points
at the 30% budget; the existing network reaches 3%.

Species complementarity
Species richness (non-complementary)
Trait-space complementarity
c
Negative = the high end of that axis is under-protected.
Quasi-binomial GLM weighted by range area, controlling
range size. * BH-adjusted P < 0.05.
